DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA-2015-N-1349]

Electronic Study Data Submission; Data Standards; Support for the Logical Observation Identifiers Names and Codes

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice; request for comments.

SUMMARY: The Food and Drug Administration (FDA) is encouraging sponsors and applicants to provide Logical Observation Identifiers Names and Codes (LOINC) codes (available at <http://loinc.org/>) for clinical laboratory test results in investigational study data provided in regulatory submissions submitted to the Center for Drug Evaluation and Research and to the Center for Biologics Evaluation and Research. LOINC code is defined as electronic messages for laboratory test results and clinical observations. The decision to adopt LOINC for lab test results is part of a larger FDA effort to align the use of data standards for clinical research with ongoing nationwide health information technology initiatives. FDA invites public comment on appropriate steps the Agency could take to promote the use and utility of LOINC-coded clinical data submitted to the Agency. The LOINC common terminology will be listed in the FDA Data Standards Catalog that is posted to FDA's Study Data Standards Resources Web page at

Centers for Medicare & Medicaid Services

Long term goal of unification across settings. Representing all data elements from assessment instruments in LOINC.

Focused on MDS, OASIS, IRF-PAI, LCDS instruments now.

2,000+ individual data elements!

The screenshot shows the CMS.gov website page for the IMPACT Act of 2014. The page title is "IMPACT Act of 2014 Data Standardization & Cross Setting Measures". The page content includes a navigation menu with categories like Medicare, Medicaid/CHIP, Medicare-Medicaid Coordination, Private Insurance, Innovation Center, Regulations & Guidance, Research, Statistics, Data & Systems, and Outreach & Education. The main content area is titled "IMPACT Act of 2014 Data Standardization & Cross Setting Measures" and includes a "Quality Initiatives: IMPACT Act of 2014" section. The "Background:" section states that on September 18, 2014, Congress passed the Improving Medicare Post-Acute Care Transformation Act of 2014 (the IMPACT Act). The Act requires the submission of standardized data by Long-Term Care Hospitals (LTCHs), Skilled Nursing Facilities (SNFs), Home Health Agencies (HHAs) and Inpatient Rehabilitation Facilities (IRFs). Specifically, the IMPACT Act requires, among other significant activities, the reporting of standardized patient assessment data with regard to quality measures, and patient assessment instrument categories. It further specifies that the data "... be standardized and interoperable so as to allow for the exchange of such data among such post-acute care providers and other providers and the use by such providers of such data that has been so exchanged, including by using common standards and definitions in order to provide access to longitudinal information for such providers to facilitate coordinated care and improved Medicare beneficiary outcomes...". The Act also requires the submission of data pertaining to measure domains pertaining to resource use, and other domains. In addition, through the use of standardized data, the IMPACT Act intends for post-acute care data comparability, and importantly, the Act conveys the inclusion of patient-centeredness in its references and requirements related to capturing patient preferences and goals. The IMPACT Act provides a tremendous opportunity to address all of the priorities within the CMS Quality Strategy, which is framed using the three broad aims of the National Quality Strategy:

- **Better Care:** Improve the overall quality of care by making healthcare more patient-centered, reliable, accessible, and safe.
- **Healthy People, Healthy Communities:** Improve the health of the U.S. population by supporting proven interventions to address behavioral, social, and environmental determinants of health in addition to delivering higher-quality care.
- **Affordable Care:** Reduce the cost of quality healthcare for individuals, families, employers, and government.

The IMPACT Act supports these three aims while upholding the CMS Quality Strategy's goals, which are:

1. Making care safer by reducing harm caused in the delivery of care.
2. Ensuring that each person and family is engaged as partners in their care.
3. Promoting effective communication and coordination of care.
4. Promoting the most effective prevention and treatment practices for the leading causes of mortality, starting with cardiovascular disease.
5. Working with communities to promote wide use of best practices to enable healthy living.
6. Making quality care more affordable for individuals, families, employers, and governments by developing and spreading new healthcare delivery models.

Radiology procedure codes are a fundamental part of most radiology workflows, such as ordering, scheduling, billing, and image interpretation. Nonstandardized unstructured procedure codes have typically been used in radiology departments. Such codes may be sufficient for specific purposes, but they offer limited support for interoperability. As radiology workflows and the various forms of clinical data exchange have become more sophisticated, the need for more advanced interoperability with use of standardized structured codes has increased. For example, structured codes facilitate the automated identification of relevant prior imaging studies and the collection of data for radiation dose tracking. The authors review the role of imaging procedure codes in radiology departments and across the health care enterprise. Standards for radiology procedure coding are described, and the mechanisms of structured coding systems are reviewed. In particular, the structure of the RadLex™ Playbook coding system and examples of the use of this system are described. Harmonization of the RadLex Playbook system with the Logical Observation Identifiers Names and Codes standard, which is currently in progress, also is described. The benefits and challenges of adopting standardized codes—especially the difficulties in mapping local codes to standardized codes—are reviewed. Tools and strategies for mitigating these challenges, including the use of billing codes as an intermediate step in mapping, also are reviewed. In addition, the authors describe how to use the RadLex Playbook Web service application programming interface for partial automation of code mapping.

Letter to the Editor

Letter to the Editor—Comments on the Use of LOINC and SNOMED CT for Representing Nursing Data

We are writing in response to Keenan et al.'s article (2017), "A Shovel-Ready Solution to Fill the Nursing Data Gap in the Interdisciplinary Clinical Picture," in which the authors recommend that the American Academy of Nursing (AAN) should update its 2014 recommendations (Clancy et al., 2014) for using the SNOMED CT and Logical Observation Identifiers Names and Codes (LOINC[®]) terminologies in favor of a tool such as the Hands-on Automated Nursing Data System (HANDS). HANDS is a commercial software module for collecting nursing data that requires custom interfaces to connect with electronic health record systems (EHRs). To start, it is important to distinguish between terminologies and software. Standard terminologies, including the NANDA International (NANDA-I) diagnoses, the Nursing Intervention Classification (NIC) interventions, the Nursing Outcome Classification (NOC) outcomes, SNOMED CT and LOINC, are intended to be technology-neutral. Although HANDS uses standard terminologies (NIC, NOC and NANDA-I), it is proprietary software, and it would be highly inappropriate for

LOINC and SNOMED CT are complementary terminology standards that are both required by the Meaningful Use regulations in the United States as well as eHealth initiatives in other countries. In July 2013, the Regenstrief Institute, Inc., which maintains the LOINC terminology, and SNOMED International (formerly known as IHTSDO) signed a landmark long-term collaboration agreement to align how LOINC and SNOMED CT represent laboratory tests and some types of clinical measurements (Regenstrief Institute and SNOMED International, 2013). In general, LOINC is used to represent the observation being collected (the "question") and SNOMED CT is used for the observation value (the "answer"). For example, LOINC code 80345-2 "Pressure points examined" would be used to record the SNOMED CT values for the anatomical locations, such as occiput, elbow or heel, that were evaluated during a nursing skin assessment. Quantitative observations, such as diastolic blood pressure or the width of a wound, are typically recorded using LOINC codes with numeric results as the observation values. Other parts

Conflict of Interest: The HANDS

CONCLUSIONS: Authors present recommendations for revisions to AAN's plan and an evidence-based alternative to generating interoperable nursing data in the near term. These revisions can ultimately lead to the proposed terminology goals

Letter to the Editor

Re: Unit conversions between LOINC codes Published

June 19, 2017

Daniel J Vreeman,¹ Swapna Abhyankar,² and Clement J McDonald³

¹Director, LOINC and Health Data Standards, Regenstrief Institute; Regenstrief-McDonald Scholar in Data Standards, Indiana University School of Medicine, Indianapolis, IN, USA, ²Associate Director for Content Development, LOINC and Health Data Standards, Regenstrief Institute, Indianapolis, IN, USA and ³Director, Lister Hill National Center for Biomedical Communications, National Library of Medicine, National Institutes of Health, Bethesda, MD, USA

We applaud the work of Hauser et al.,¹ who have realized the potential for converting result values associated with one Logical Observation Identifiers Names and Codes (LOINC) term to those associated with another through mathematical operations. They applied these transforms to pairs of terms in several categories, including those expressed as molar versus mass units, simple counts on different scales, linear versus log values, and 2 terms that are inver-

“mmol/L” or “mg/24 h” would not be allowed for mass concentration terms, because the first has a molar unit in the numerator rather than a mass unit and the second has a time unit in the denominator rather than a volume unit; instead, these units represent **molar concentration** (moles/volume) and **mass rate** (mass/time), respectively. As Hauser et al. illustrated, discrepancies between the *Property* of a LOINC term and the reported units of measure for a test signal a po-

ABSTRACT

Logical Observation Identifiers Names and Codes (LOINC) is the most widely used controlled vocabulary to identify laboratory tests. A given laboratory test can often be reported in more than 1 unit of measure (eg, grams or moles), and LOINC defines unique codes for each unit. Consequently, an identical laboratory test performed by 2 different clinical laboratories may have different LOINC codes. The absence of unit conversions be-

LOINC Award for Distinguished Contributions

Purpose

The *LOINC Award for Distinguished Contributions* honors an individual who has made sustained and enduring contributions that advance health data interoperability with LOINC.

Award Criteria

This award recognizes exceptional and enduring actions, activities, and accomplishments that advance LOINC and its use to improve health. A member of the LOINC community is eligible for this award based on their thought leadership, successful implementation, promotion of awareness and adoption, education, and/or fostering cooperation and collaboration.

Award Presentation

The *LOINC Award for Distinguished Contributions* will be presented at the [June Laboratory LOINC Committee meeting](#).

LOINC honors Susan Matney for contributions to advancement of health data interoperability

By Katie Allen

June 21, 2017 (2017-06-21)

Press Release

INDIANAPOLIS – LOINC, the world's most commonly used universal code system for identifying medical test results, observations and other clinical measurements, has announced the recipient of the annual [LOINC Award for Distinguished Contributions](#). The award, in its second year, honors individuals whose work advances the interoperability that ensures that medical data can be recorded, electronically exchanged and ultimately used to improve health -- when and where needed.

Susan Matney

Susan Matney, PhD of Salt Lake City, Utah was presented with the award at the annual LOINC meeting in June. Matney is long-time active member of the LOINC community.

Matney, a veteran nurse, is now a Senior Medical Informaticist with Intermountain Healthcare. She is a Fellow of the American Academy of Nursing and was selected as the 2007 pioneer in nursing informatics by the AMIA nursing working group. Recognizing the need to harmonize the use of LOINC with another leading multidisciplinary terminology, Dr. Matney led efforts to create collaboration between the two to meet the needs of the nursing community. As part of the Nursing Knowledge Big Data Science Initiative, Dr. Matney co-leads a workgroup focused on clinical models and terminology standards. Matney was instrumental in

Introducing our new webinar series for LOINC Premium Members

LOINC Premium Members have exclusive access to our new LOINCinar series. A LOINCinar is an interactive webinar covering all things LOINC. They are a great opportunity to learn more about LOINC, ask questions, and hear directly from our team of experts. LOINCinars are offered every 4-6 weeks as 60-minute live events covering a variety of topics. Each session offers in-depth explanations and allows plenty of time for your questions. Our goal is for you to succeed with LOINC.

[Send us your suggestions for future LOINCinar topics](#)

NEXT LOINCINAR

We will be announcing our next LOINCinar very soon!

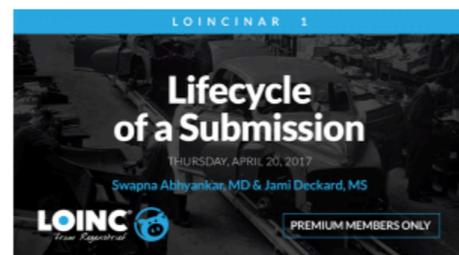

LOINC Premium Members, watch your email for details and how to RSVP.
